

HEADLESS REVENUE

The Headless CRM Readiness Checklist

**12 questions to answer before you let AI agents
touch your revenue stack**

Salesforce went headless. The browser stopped being the interface. Agents now consume capabilities, not screens — and most revenue stacks were never architected for that.

The interface layer just collapsed.

Salesforce Headless 360 exposes every capability built over 25 years as an API, an MCP tool, or a CLI command. Read that as what it is: an admission that the browser is a bottleneck for AI.

That shift moves the risk. When a human drove the UI, a badly defined field or an ambiguous metric produced a confused rep who asked someone. When an agent drives the API, the same ambiguity produces confident, wrong action at machine speed — and no one notices until the number lands in a board deck.

This is why agent pilots stall. Not the model. The foundation underneath it: what the data means, who governs it, and whether business logic is reachable without a screen.

The twelve questions in this checklist are the ones worth answering before you give an agent write access to anything that touches revenue. They take about twenty minutes and they are deliberately uncomfortable.

How to score it

Score each question 0 to 3. 0 = no idea / not true. 1 = partially, informally. 2 = mostly true, some gaps. 3 = true, documented, and someone owns it. Twelve questions, 36 points available.

System of record integrity

An agent cannot resolve a conflict it cannot see. Before anything reads your data automatically, one place has to be authoritative.

- 1 Is there one unambiguous system of record for each core object — account, opportunity, contact — that everyone would name the same way?

score

- 2 Can you name the owner of every field that feeds a revenue metric, and say when it was last reviewed?

score

- 3 What percentage of your records would survive a dedupe audit run today, without anyone tidying up first?

score

Red flag: two teams export the same object from two systems and reconcile in a spreadsheet.

NOTES / EVIDENCE

Semantic layer

The most expensive failure in AI-driven revenue work is a metric that means two things. Agents inherit that ambiguity and scale it.

- 1 Is ARR — and 'active customer', and 'qualified' — defined once, centrally, or redefined inside each dashboard and report?

score

- 2 If two different tools are asked the same revenue question today, do they return the same number?

score

- 3 Are your metric definitions versioned and reviewable, so you can see what changed and who changed it?

score

Red flag: the answer to 'what is ARR' depends on which team you ask.

NOTES / EVIDENCE

Governance & cost control

Agentic projects are cancelled for two reasons: nobody can explain what the agent did, and nobody can explain what it cost.

1 Is there an audit trail that shows why an automated action fired — the inputs, not just the outcome?

score

2 Can you attribute AI and agent spend to a specific team, workflow, or business outcome, rather than one line on a bill?

score

3 Who approves an agent's write access to production data, and is that a defined process or an ad-hoc decision?

score

Red flag: your AI spend is a single unattributed line item nobody can defend at renewal.

NOTES / EVIDENCE

Integration surface

Headless means business logic is reachable without a screen. Most stacks have critical logic trapped in the UI layer.

- 1 Is your core business logic callable via API, or is it trapped inside UI-layer workflows, page rules, and button behaviour?

score

- 2 Could an agent complete your top three revenue workflows end to end without ever rendering a browser?

score

- 3 How many integrations would break if you replaced your CRM's front end tomorrow but kept the data?

score

Red flag: your automation depends on a screen existing, and nobody has tested it headlessly.

NOTES / EVIDENCE

Add it up. 36 points available.

0 – 14

Not agent-ready

Piloting agents now will produce a demo that impresses and a rollout that quietly dies. Fix the system of record and metric definitions first. This is six to twelve weeks of unglamorous work and it is the highest-return thing on your roadmap.

15 – 26

Partially ready

Pilot, but contain it. Pick one workflow with a clear owner, a measurable outcome, and read-only access to start. Instrument cost attribution before you scale, not after — retrofitting it is what kills the business case.

27 – 36

Headless-ready

Your foundations will hold. Scale deliberately: expand agent write access one workflow at a time, keep the audit trail reviewable, and revisit the semantic layer every time you add a source system.

One caveat worth stating: a low score is not a failure of your team.

Almost every stack was architected for humans clicking screens. That was correct at the time.

Know your score. Not sure what to fix first?

That second question is usually the expensive one.

I work with B2B SaaS teams at Series A to C on exactly this: revenue systems architecture, headless CRM, semantic layers, data governance, and custom MCP servers — the foundation work that decides whether your agent programme compounds or gets cancelled.

Book a 30-minute architecture review

Bring your score. We will walk the two lowest dimensions and you will leave with a prioritised list, whether or not we work together.
